

# **The Role of Traditional and Alternative Energy in Economic Development of Rural Communities**

Tony Ahern  
President & CEO  
Buckeye Power, Inc. &  
Ohio Rural Electric Cooperatives, Inc.  
*January 20, 2008*

# Energy Efficiency: *“the low hanging fruit”*

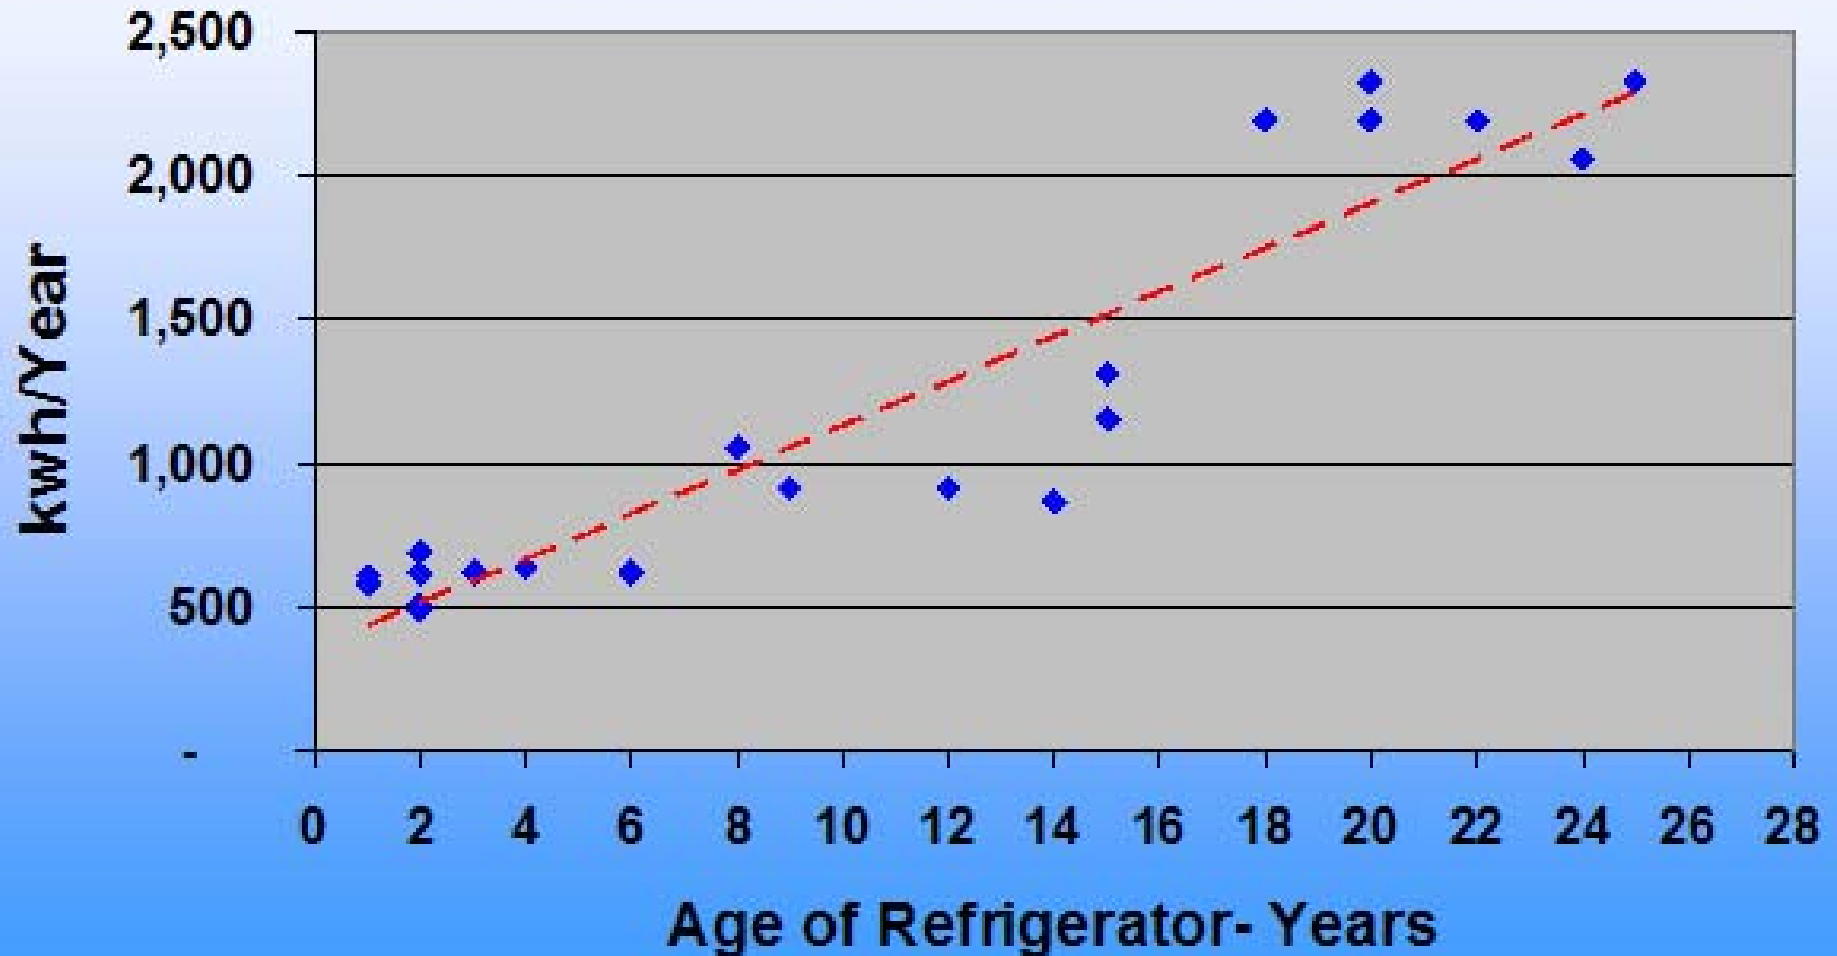

- Google search yields **865,000** hits
- Since new appliances, air conditioners and heat pumps are more efficient than older units, what's inhibiting Energy Efficiency?

Refrigerators are one of the larger home electricity uses:

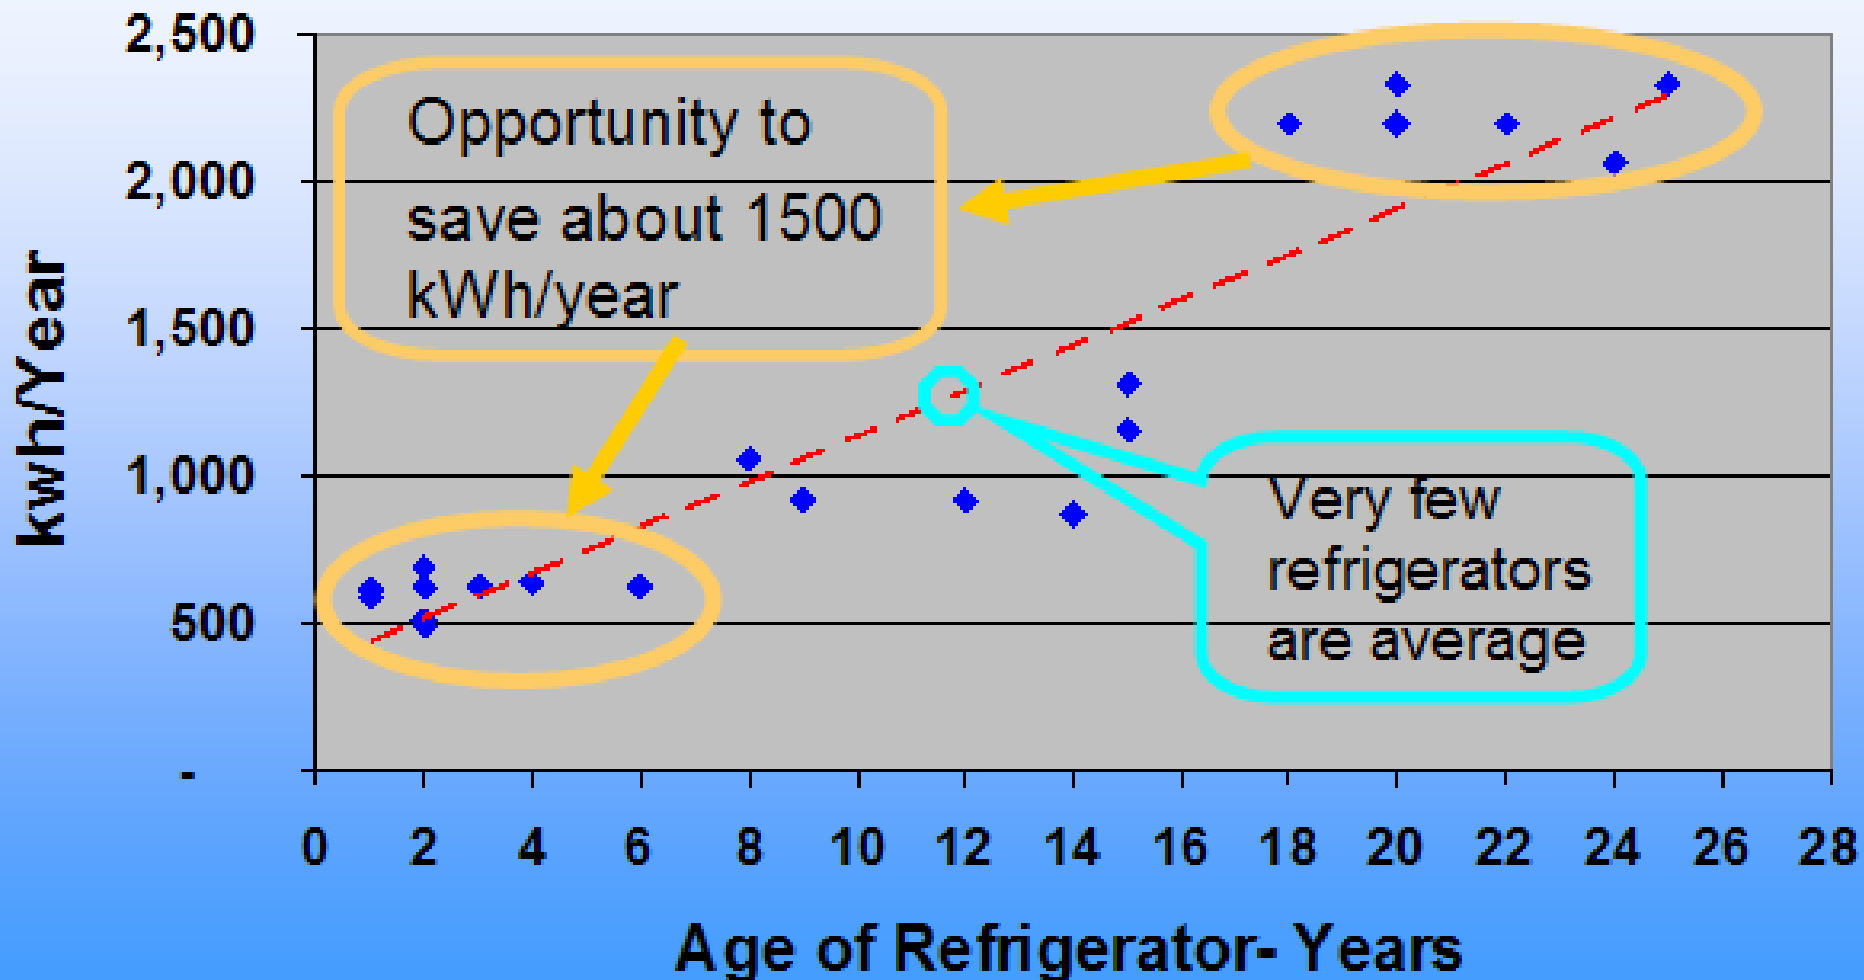

***“one of the lowest hanging fruits”***

- Average refrigerator uses 1,239 Kwh/yr.  
([http://www.eia.doe.gov/emeu/reps/enduse/er01\\_us.html](http://www.eia.doe.gov/emeu/reps/enduse/er01_us.html))
- Average lifetime 14 yrs  
([www.energystar.gov/refrigerators](http://www.energystar.gov/refrigerators))

## Refrigerator Population of Ohio Statewide and G&T office personnel

# Refrigerator Population of Ohio Statewide and G&T office personnel

# Refrigerator Economics 101:

		Years to break even when saving 1500 kWh/yr		
electricity \$/Kwh	cost of refrigerator			
	\$ 500	\$ 1,100	\$ 2,200	
\$ 0.10	3.3	7.3	14.7	
\$ 0.15	2.2	4.9	9.8	

**Consumers' Energy Efficiency decisions:** *individual preferences, information and financial resources.*

- EE may be the lowest hanging fruit

- EE may be the lowest hanging fruit
- But the EE fruit may be in a very tall tree

# Unrealistic Wind Expectations

- **Environment Ohio** says 20% of Ohio's electricity can come from wind turbines on Lake Erie

<b>Ohio's Annual Electric Use</b>	<b>160 million MWH *</b>
<b>20% of Annual Electric Use</b>	<b>32 million MWH</b>
<b>2 MW Wind Turbine Annual Output</b>	<b>6,154 MWH</b>
<b>Number of Wind Turbines Needed</b>	<b>5,200</b>

\* EIA/DOE Data Tables for 2005

\*\* Based on 35% Annual Capacity Factor

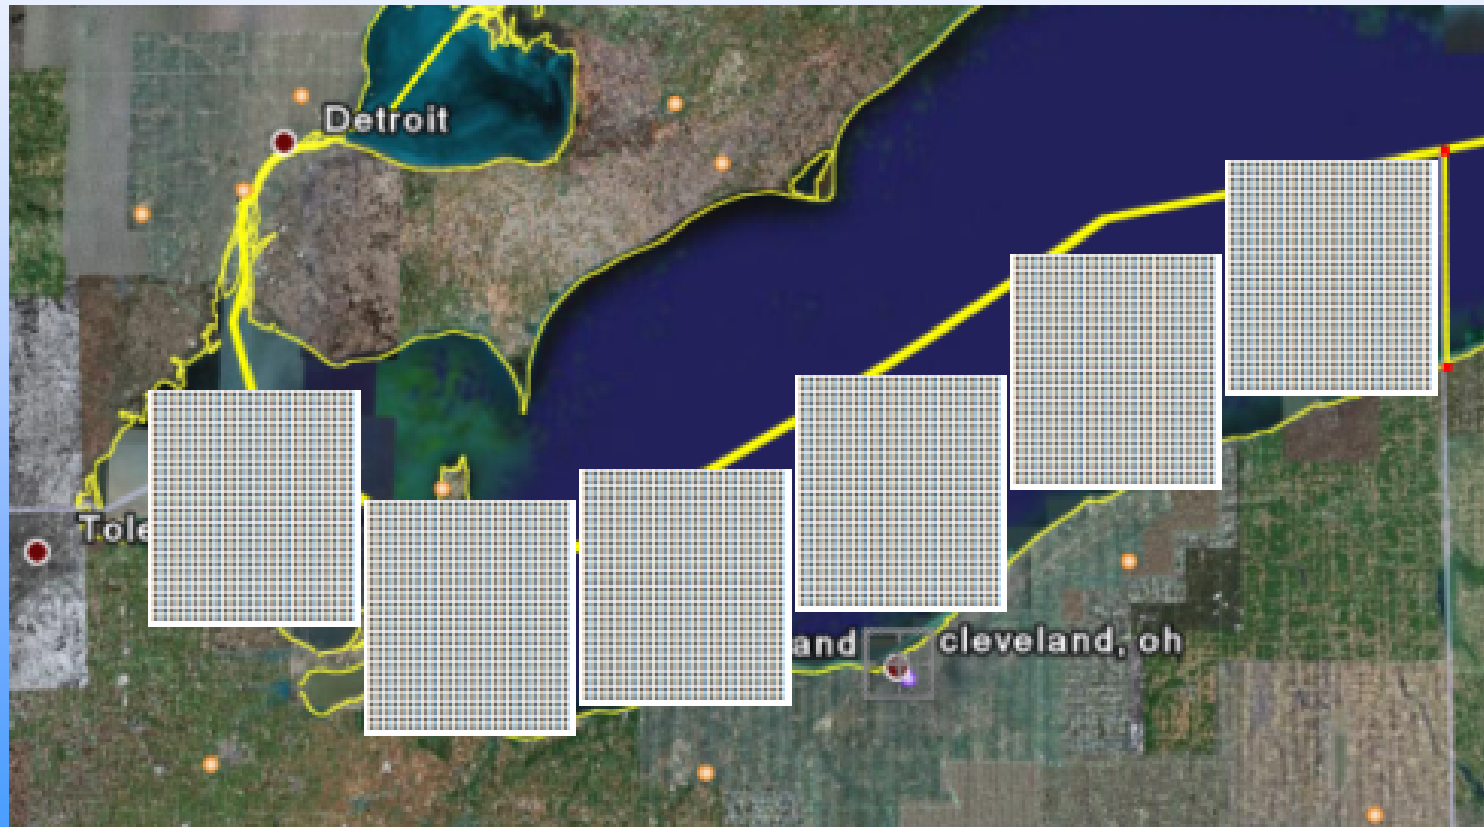

# 5,200 Wind turbines in Ohio's portion of Lake Erie

30 Wind Turbines North-South by  
175 Wind Turbines East-West

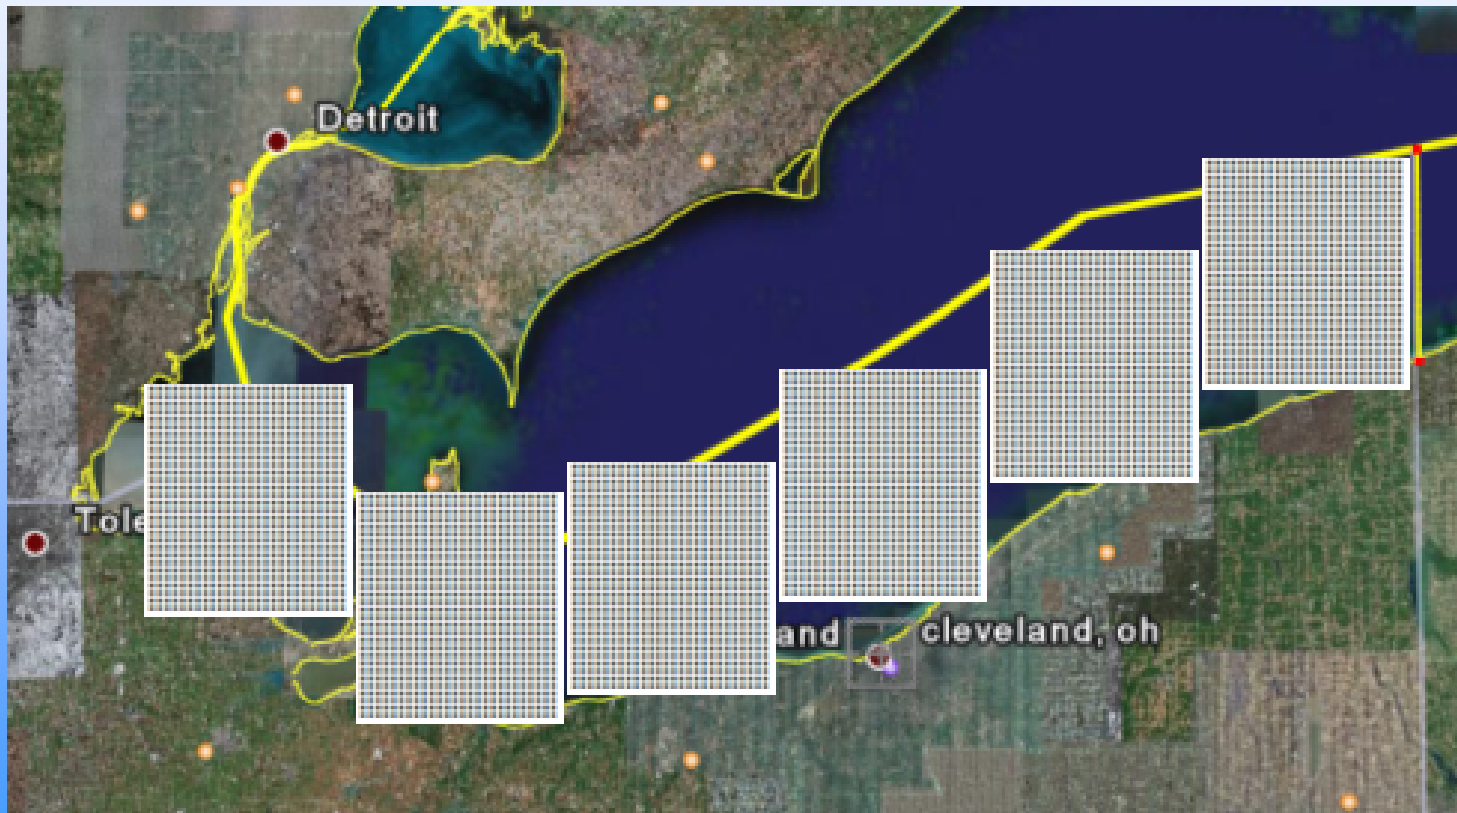

# 5,200 Wind turbines in Ohio's portion of Lake Erie

30 Wind Turbines North-South by  
175 Wind Turbines East-West

5,200 Wind turbines  
in Ohio's portion of Lake Erie  
***Is this really practical?***

# Many things are possible, but not all are practical

- There is much for rural communities to be excited about with alternative energies.  
...but, expectations may exceed realities.
- There is a new factor that will significantly affect the rural energy economy:

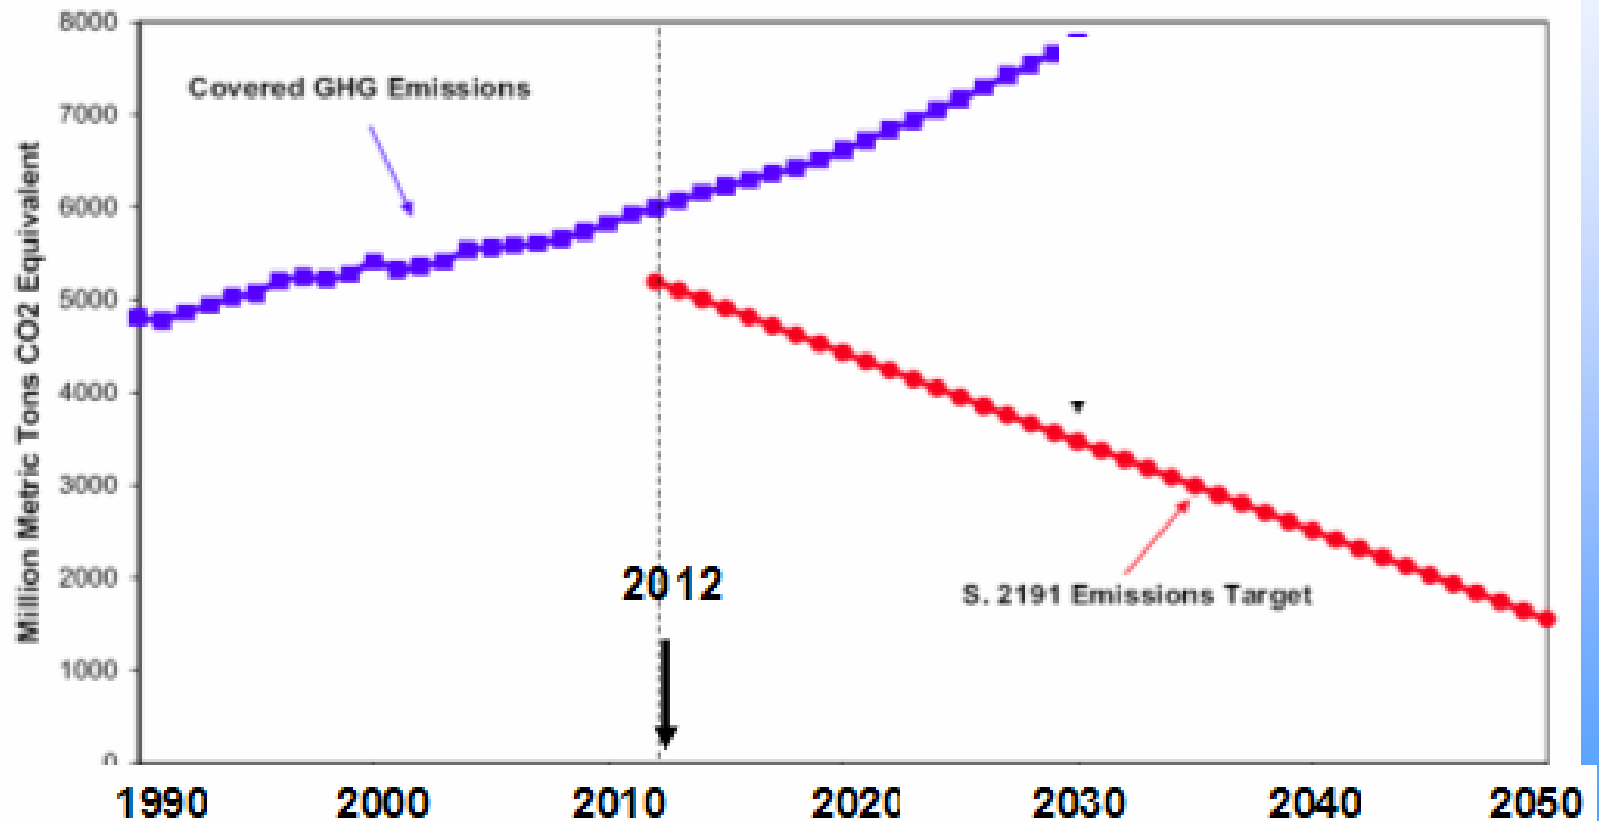

***Global Climate Change legislation***

## **“Lieberman-Warner Climate Security Act of 2007” (S.2191)**

- approved by the *Senate Committee on Environment and Public Works* and forwarded to the full Senate.

# S. 2191 requires substantial reductions in “covered emissions”

## U.S. Greenhouse Gas Emissions: Under E.I.A. Baseline Forecast & S.2191 Targets

Source: "Energy Market and Economic Impacts of S.280, the Climate Stewardship and Innovation Act of 2007". U.S. Department of Energy, Energy Information Administration, August 2007 and ACCF calculations.

# S. 2191 requires substantial reductions in “covered emissions”

## U.S. Greenhouse Gas Emissions: Under E.I.A. Baseline Forecast & S.2191 Targets

Source: "Energy Market and Economic Impacts of S.280, the Climate Stewardship and Innovation Act of 2007". U.S. Department of Energy, Energy Information Administration, August 2007 and ACCF calculations.

# S.2191 will increase fossil fuels prices

**MIT estimates  
CO<sub>2</sub> at \$55/ton in 2015 <sup>(1)</sup>**

Affect of CO2 Adder	
1 gallon of gasoline	\$ 0.49
1 gallon of diesel	\$ 0.56
1000 ft <sup>3</sup> of natural gas	\$ 3.03
1 kw-hr from U.S. gen mix	\$ 0.03
1 kw-hr from coal	\$ 0.06

(1)“Assessment of U.S. Cap-and-Trade Proposals” MIT Report issued by Joint Program on the Science and Policy of Global Change, April 2007

## ***Affect of \$55/ton CO<sub>2</sub> on the typical U.S. household***

- \$30-\$60/month more for electricity
- \$30-\$50/month more for gasoline
- \$30-\$50/month more for heating

**Total = \$90-\$160/month**

# **Global Climate Change legislation could boost economic development in rural communities**

- Non-fossil fuel alternative energy businesses might flourish in some areas.
- Energy efficiency businesses might flourish.

**But, GCC legislation will significantly change the energy economy of rural communities**

# Higher energy prices will hurt economic development of rural communities

- Low income people will have more difficulty paying energy bills
- Discretionary spending in the local economy will be reduced
- Marginal businesses may not survive
- Existing energy intensive businesses will leave, new ones won't come

## ***Electric utility options to reduce CO<sub>2</sub> emissions at \$55/ton by 2020***

- Coal to natural gas switch (not economical)
- Coal w/ Carbon Capture & Storage (not ready)
- New nuclear capacity (limited impact)
- Wind turbines (could provide 2-3% at current annual rate of additions)
- Solar PV (too expensive \$0.70/kwh)
- Energy Efficiency (will offset some growth)

# Thoughts for State Legislators

- Proposed solutions need to be ***properly vetted***; don't be afraid to ask for details.
- ***False starts and reverses*** in the energy arena can be detrimental to the economy.
- Economic growth and energy use are highly correlated; ***S.2191 ignores this correlation***
- How to ***close the gap*** between the needs of a growing economy and requirements for declining CO<sub>2</sub> emissions?

What will it take to close the gap?

**Thomas L. Friedman**  
**9/19/07 NYT Op-Ed piece**  
***“Doha and Dalian”***

“That’s why we’re fooling ourselves. There is no green revolution, or, if there is, the counter-revolution is trumping it at every turn. Without a transformational technological breakthrough in the energy space, all of the incremental gains we’re making will be devoured by the exponential growth...”

# Transformational Technological Change Takes Time

Sources of U.S. Energy (% by year)
